

## From practical people for practical people

### Small, but mighty: the mobile air circulating heating unit „Air Heater“

bodus' „Air Heater“ is a compact and powerful air circulating heating unit, designed to accelerate the curing process of inliner in the field of house connections.

The “Air Heater” shows its strengths in renovation of drain pipes or on short renovation sections, when installation of large heating units would be highly time-consuming or too laborious. With its lightweight and compact design, the “Air Heater” can be installed and used in confined spaces or in inaccessible sites. Sewer rehabilitation that meets the demands of quality is no longer an issue!

The operating principle of the “Air Heater” is similar to a hair dryer, it circulates hot air in the relined pipeline and thus shortens the curing time especially of cold setting resins **many times over**.

Handling, connecting to the impregnated liner and the operation of the device is very simple. All required parameter, which are necessary for the heating process can be adjusted and controlled easily understood.

On construction sites, the Air Heater is also often used as second heating unit by our customers. For example, when the larger main line is cured with one of our steam generators, smaller secondary lines or drain pipes can be heated and cured with the Air Heater. By means of this technique our Air Heater has more than paid off even after a short time and you will never want to do without it again.
